

Application of Relay Protection in 110kV Substations

Overview

Relay protection is essential to ensure the stability, reliability, and safety of electrical power systems. Fingrid's application guideline for relay protection presents the operating principles of the relay protection in Fingrid's 110, 220 and 400 kV power networks and the requirements for operation of the protection systems of Fingrid customers (hereinafter referred to as 'customer'). In HV (High Voltage) and MV (Medium Voltage) substations, relay protection safeguards critical assets such as transformers, circuit breakers, and lines. Effective relay protection depends on. Westinghouse Electric Corporation prepared a System Requirements Specification for a "Substation Control and Protection System" for EPRI Research Project RP-1359-1 in April 1980 and developed the WESPAC system based on this specification in 1980s. The first numerical relays were released in 1985.
