

# Can single-mode and dual-mode fiber optic cables be used interchangeably

## Overview

There are two main types of fiber optic cables: single mode and multimode. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. That makes picking between single mode and multimode fiber optic cables an. Unlike copper cables, which rely on electrical signals, fiber optics use pulses of light to transmit data—offering unmatched bandwidth, low interference, and long-distance capabilities. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types. Single-mode (SMF) and multi-mode fiber (MMF) use different core sizes, sources and wavelengths. These differences determine which transceivers work with which fiber and how far signals can travel. Understanding the compatibility constraints prevents costly downtime and troubleshooting.
