

How to determine whether a fiber optic transceiver is single-mode or multi-mode

Overview

The easiest way to determine the type of your SFP module is by checking the label or the product's specifications. Typically, single mode SFP modules are labeled as "SM" or "single mode," while multimode modules may be labeled as "MM" or "multimode." The choice impacts the transmission distance, data rate, and cost of your setup. For long-distance networks, single-mode is typically preferred, while multimode is more common in short-distance. How to distinguish whether an optical fiber module is single-mode or multi-mode?

Optical modules are core photoelectric conversion components in fiber-optic communication, data centers, enterprise networks, and telecom transmission systems. A size distinction exists between single-mode and multimode fiber cores. Multimode fiber has a wider fiber core, generally 50um for OM2/OM3/OM4/OM5 fiber and 62.
