

Incompatibility of optical modules at both ends of the transmission

Overview

Solution: First check whether the optical port is on, then check whether the optical module parameters (such as wavelength, rate and transmission distance) inserted by the devices at both ends match, and whether the optical module type (single mode/multi-mode) matches. Solution: First check whether the optical port is on, then check whether the optical module parameters (such as wavelength, rate and transmission distance) inserted by the devices at both ends match, and whether the optical module type (single mode/multi-mode) matches. When it comes to the connection between two fiber optic transceivers, the following four factors should be taken into considerations: wavelength, speed, fiber type, and the connection to switches. 1, Same wavelength In a fiber optic link, data is transmitted from one end to the other, and the optical module is responsible. Ensuring seamless interoperability between optical modules is crucial for maintaining efficient and reliable network operations. Four primary factors contribute to this compatibility: same wavelength, same speed, correct fiber type, and proper switch configuration. The USG supports both 1 Gbit/s optical modules.
