

Laser Diode Pulse Width Measurement

Overview

Techniques such as FROG or SPIDER provide detailed pulse characterization beyond just duration and energy. Our time-domain optimized high-speed detectors are commonly used for measuring the pulse shape of short-pulsed lasers or for generating an optical trigger signal from short optical pulses. Some important considerations must be taken into account when these types of measurements are made. Different definitions of pulse duration, including the common FWHM method, are. Abstract: Semiconductor lasers merge coherent light emission with photodetection and, owing to third-order nonlinearities in their active region, function as sensitive room-temperature two-photon absorption (TPA) detectors. Here, we leverage these capabilities offered by a commercially available. Thorlabs' Nanosecond Pulsed Laser Diode Systems are designed to provide a convenient, turnkey source of nanosecond pulse trains at repetition frequencies up to 10 MHz. These compact instruments consist of a laser head, an external +15 V power supply with location-specific plug, and two ECM225. ly characterize this spectral purity.
