

Neutral and live wire connection terminals in the distribution box

Overview

Live Wire (Red/Black): Connects to the switch input terminals. From the switch output, connect a. A distribution board or distribution box is where the main power supply is distributed to multiple loads. All the electrical sub circuits are originated from a Distribution Board. It includes isolator, RCCB (Residual current circuit breaker) or RCD (Residual-current device) devices, protective fuses or MCB's (Miniature Circuit Breaker). The electrical service panel, commonly called a breaker box, serves as the central distribution point for all electrical power entering a structure. It is the critical interface where the utility's power is divided into individual branch circuits that feed the lights, outlets, and appliances. Single phase DB box wiring involves connecting the live, neutral, and earth wires to their respective terminals in the distribution board.
