

Optical module receives 0dBm light

Overview

Beyond sensitivity, the receiver is defined by its saturation or "optical overload" point, which is generally rated at 0dBm. This wide dynamic range allows the module to handle high-intensity signals from very short patch cables without damaging the photodetector or causing. 0dBm describes the transmit launch power of a coherent pluggable module — 10 dB higher than the -10 dBm of standard 400ZR optics. Higher launch power makes pluggable transceivers compatible with ROADM-based service provider networks, extending practical reach to over 1,000 km in demonstrated. Optical loss is measured in "dB" which is a relative measurement, while absolute optical power is measured in "dBm," which is dB relative to 1mw optical power Loss is a negative number (like -3. Receive power is normally expected between - 1 and -9. Diagnostic information: Temperature (Celsius) :33.
