

Passive Devices in ODN Networks

Overview

Key components of a Passive Optical Network include the Optical Line Terminal (OLT), Optical Network Unit (ONU) or Optical Network Terminal (ONT), Optical Distribution Network (ODN), and Optical Splitters. An OLT is a device used to interface between the service provider's central. In the present high-speed digitized environment, Passive Optical Networks (PON) have become a pivotal solution to meet the demands of Big Data. PON primarily utilizes a point-to-multipoint topology and fiber optical splitters to transmit data from a single point of transmission to multiple user. A passive optical network (PON) or Gigabit Passive Optical Network (GPON) is a point-to-multipoint (P2MP) network that uses a combination of active transmission equipments and passive cable components to provide network connectivity to end user's devices. To date, most FTTH deployments in planning and deployment have used PON to save on fiber costs. PON has attracted much attention in recent years due to its low cost and high performance.
