

Single-mode multi-mode fiber optic conversion indicator light

Overview

Detects optical power in single mode and multimode fiber wavelengths (near infrared range 850 nm to 1625 nm). No setup or interpretation needed – light and sound indicate presence of an optical signal. It receives the optical signal on one port, converts it into an electrical signal, and then retransmits it as an optical. Fiber media converters quietly solve a big, practical problem: they bridge copper Ethernet to fiber and extend links far beyond copper's reach. In real networks such as campuses, factories, metro POPs converters let you reuse existing switches and still run fiber for long distance, EMI immunity. Verify that the fiber media you are using matches the model of this fiber optic transceiver. The performance of the transmission, including speed and distance. Multimode to Single mode fiber or vice versa Our mode converters support a wide variety of burst and continuous data rates including Gigabit Ethernet.
