

Structure of the optical cable plug

Overview

Optical connectors are precision components that protect the tips of optical fibers and connect them in the correct position, and are primarily made up of three main parts: the ferrule, the connector body, and the mating mechanism. An optical fiber connector enables quicker connection and disconnection than splicing. They come in various types like SC, LC, ST, and MTP, each designed for specific. This guide will walk you through the most common fiber connector types, explaining their characteristics, advantages, and typical use cases. The methods of fixing joints include fusion splicing method, V-groove method, capillary method, casing method, etc. The connector mechanically orients the fiber cores, allowing light to pass and travel through. The function of fiber optic connectors is to align and connect two or more fibers together to provide a means for attaching to, or decoupling from, a transmitter, receiver, or any other fiber optic component.
