

What does SOH mean in fiber optic communication

Overview

SOH refers to the information that is added to the payload data of a digital transmission frame. The SOH is typically located at the beginning of each frame and is followed by. Standard test method used primarily in aerospace and spacecraft applications to evaluate how much an epoxy material outgasses in a vacuum environment to ensure they meet the total weight loss (TML) and condensable volatile material (CVCM) thresholds. Standard Test Conditions run at 125°C (257°F). The Section Layer involves transporting an STS-N data stream across the physical medium (e., copper or optical fiber) in a point-to-point manner (e. Numerical Aperture (NA): A measurement of the range of angles over which the fiber can accept or emit light. Singlemode Fiber (SM / SMF): Fiber with a small core ($\sim 9\mu\text{m}$) that allows only one mode of light. Second, the SOH standards, since they include operations and maintenance, contain many protocols written by software and protocol experts. For the average transmission person, this is enough to give one a splitting Double Headache.
